

HabFarms Onboarding and User Guide

Set up your farm in the right order, then use daily records to see trustworthy operational and financial results.

This guide is for farm owners, managers, and workers using HabFarms for the first time. Complete the setup steps before relying on dashboards, inventory balances, feed forecasts, cash flow, or profitability. The system is designed around recorded transactions: accurate inputs produce useful results.

Before you begin

Have these details ready. You do not need perfect historical records to start, but you should enter a clear opening position and record all new activity consistently from your chosen start date.

Prepare	Why it matters
Farm name, timezone, currency, eggs per crate	Used in dates, money values, egg conversion, and reports.
Active flock details	Sets the starting bird population and identifies every production record.
Current egg stock by grade	Creates a reliable opening inventory before grading or selling eggs.
Feed types, bag sizes, supplier details, current stock	Supports feed inventory, consumption, supplier balances, and forecasts.
Customers, current credit balances, and payment terms	Supports sales, collections, and receivables.
Team members and their roles	Gives each person only the access they need.

The recommended setup order

Follow this sequence. It prevents missing references later and keeps stock, bird totals, cash, and obligations from being mixed up.

1. Create your farm workspace and confirm Farm Settings.
2. Invite managers and workers, then confirm their access.
3. Create each active flock with its correct starting population.
4. Set egg grades and enter opening egg stock where needed.
5. Create feed types and suppliers, then enter opening feed stock or purchases.
6. Add customers and their default credit terms where you sell on credit.
7. Set supplier payment terms for future feed purchases.
8. Create feeding plans and health reminders for active flocks.
9. Begin daily production, feed, health, sales, expense, and payment recording.

1 Create your farm and review settings

During onboarding, enter the farm name. Then open Settings and confirm the operating configuration before entering transactions.

Setting	Set it correctly because
Timezone	Due dates, dashboard dates, and daily records use the farm local date.
Currency	All monetary reports, payables, collections, and cash flow use this currency.
Eggs per crate	This converts egg stock and sales into crates plus loose eggs.
Default feed bag size	Speeds up feed purchase entry; each purchase still keeps its own historical bag-size snapshot.
Opening cash balance	Defines the starting point for tracked cash. It is not profit or revenue.
Feed warning thresholds	Controls when low-feed items need attention.

Important: Do not change opening balances casually after daily activity has begun. Use the correct adjustment workflow if a correction is needed.

2 Add your team and choose roles

Open Settings, then Users, to invite people by email. The invitation process assigns the person to your farm only after they accept.

Role	Typical responsibilities	Financial visibility
Admin	Farm settings, users, operational records, commercial records, approvals and corrections.	Full farm access.
Manager	Flocks, production, feed, health, sales and operational reporting within the approved role contract.	Management financial access.
Worker	Daily operational work such as permitted production and health activity entry.	No restricted cash, debt, supplier balance, or profitability data.

Use individual accounts. Do not share an admin login. Invitees should accept their own link and set their own password if they are new users.

3 Create active flocks

Go to Flocks, choose New flock, and enter one record for each distinct batch or group you manage separately. A flock is the foundation for population, production, feed planning, health, and performance reporting.

Enter	Good practice
Flock name and batch reference	Use a name your team recognizes, such as Layer House A September 2026.
Start date and initial birds	Use the real start date and the population that existed on that date.
Breed, source, house or pen	Optional where unavailable, but useful for management and traceability.

After saving a flock, use the Back to Flocks link in the page header whenever you need to return to the flock list and create another one.

Population rule: Record deaths, culls, additions, or transfers as bird movements. Do not edit the initial bird count to represent later changes. HabFarms derives live birds from the movement ledger.

4 Set up eggs and opening stock

Open Eggs to review the available egg grades. Unsorted eggs are for eggs collected before grading. The other active grades are used for grading, stock, prices, and sales.

- Enter opening stock only when bringing pre-existing eggs into the system.
- Record daily production as Unsorted or allocate the good eggs to grades during production entry.
- Grade Unsorted eggs only when you physically sort them. Grading moves eggs between grades; it does not create eggs.
- Set grade prices before sales when you want suggested prices. Price history preserves earlier sales snapshots.

Only sell eggs available in the selected grade. If stock is wrong, investigate the source records before making a correction.

5 Set up feed inventory and suppliers

Open Feed and create the feed types you buy or consume. Add suppliers, including their default payment terms if you buy on credit. Then enter opening stock for feed already on hand, or record new purchases as they occur.

Record	What HabFarms does
Opening stock	Creates a starting inventory quantity and cost basis.
Feed purchase	Adds stock, preserves the purchase price and bag-size snapshot, and creates a payable only when money remains outstanding.
Feed consumption	Reduces stock through the existing consumption ledger; it is not a purchase.
Feed adjustment	Use only for measured corrections, spoilage, or losses with a clear reason.

Supplier payment terms are a default for future purchases. Changing a supplier later does not rewrite the due date already stored on an earlier purchase.

6 Configure feed plans

Open Feed Planning and add a plan for each active flock and feed type. Enter the grams per bird per day and the effective start date. Use a new effective date when the target changes; do not overwrite historical targets.

The planned daily requirement is calculated as eligible live birds multiplied by the effective grams per bird per day, divided by 1,000. For example, 500 birds at 120 grams per bird per day gives a 60 kg daily target.

Do not guess: Actual consumption always comes from the feed consumption ledger. Planned feed and actual feed are different measures. A missing plan should be treated as not configured, not as an assumed target.

7 Set health schedules

Open Health Schedule to create reminders for a specific flock. Add the activity title, due date, and relevant details. Use the status to work through Upcoming, Due Today, Overdue, Completed, or Cancelled activities as available.

- Use a reminder to plan work.

- Use a Health Record to document work that actually happened, including products, dosage, cost, and next due date where applicable.
- Avoid entering the same event twice. A reminder is not automatically proof that a treatment was performed.

8 Add customers and begin sales

Create customers before recording credit sales. Set a default credit period only when it reflects an agreed payment arrangement. For each sale, confirm the date, egg grades, quantities, prices, discount, amount paid, and credit terms.

If a sale is	Record
Fully paid	The sale and payment; no outstanding customer balance remains.
Part-paid	The payment received and a valid due date for the remaining balance.
Credit sale	The customer and the agreed credit period or due date.
Incorrect	Use the approved edit or void workflow. Do not create a duplicate offsetting sale.

9 Record daily work consistently

Use the same business date that the activity occurred. Daily production should be recorded once per flock per date. Enter eggs collected, cracked eggs, deaths, culls, feed consumed, and any directly related operational costs accurately.

Daily or as it happens	Where to record it
Egg production, losses, feed consumed	Daily Production
Egg grading and stock corrections	Eggs
Feed purchases, consumption, stock corrections	Feed
Treatment, vaccination, observations	Health
Sales and customer payments	Sales and Collections
Operating expenses and supplier payments	Expenses and Payables
Cash introduced or withdrawn by the owner	Cash Flow adjustments

10 Understand the dashboard and reports

The dashboard is a summary of recorded transactions. It becomes useful after you have created flocks, recorded production, entered inventory, and kept sales, payments, feed, and expenses current.

Area	What to check
Live birds	Population derived from the initial flock count and later bird movements.
Egg stock	Available stock by grade after production, grading, sales, and adjustments.
Feed remaining	Inventory quantity and forecast. Check that feed consumption is being recorded.
Action Center	Low-feed, health, supplier-payment, and collection actions relevant to the signed-in role.

Daily and weekly summaries	Compare recorded production, feed plan targets, actual feed consumed, and variance.
Cash flow and profitability	Cash records are different from profit. Profit uses earned revenue and incurred costs; cash flow uses money received and paid.

A simple weekly routine

10. Check the Action Center at the start of the day and act on urgent feed, health, payable, and collection items.
11. Record production and feed consumption for every active flock on the correct day.
12. Post sales, payments, purchases, and expenses when they occur rather than waiting until month end.
13. Review the weekly summary for production, feed target versus actual, deaths, egg stock, sales, cash, and outstanding balances.
14. Correct mistakes using edit, void, or adjustment workflows with a reason. Never delete or duplicate transactions to force a total to match.

When results do not look right

Question	First checks
Live bird count is unexpected	Review flock start count and bird movements, especially their dates and quantities.
Egg stock is unexpected	Review daily production, grading, sales, opening stock, and adjustments by grade.
Feed forecast is inaccurate	Confirm current feed stock and recent feed consumption records. Check feed plans separately from historic-consumption forecasting.
Cash does not equal profit	This is often expected. Compare payments and cash adjustments with earned sales revenue and incurred costs.
A balance is overdue unexpectedly	Open the source sale or purchase and confirm its stored due date, payment history, and farm-local date.

Go live checklist

Use this checklist before you begin relying on the dashboard for decisions.

- ☐ Farm timezone, currency, crate size, and opening cash reviewed.
- ☐ Each active flock exists with the correct initial bird count and start date.
- ☐ Egg opening stock and feed opening stock are entered where applicable.
- ☐ Feed types, suppliers, customers, and payment terms are configured.
- ☐ Feeding plans are added for each flock that has a defined target.
- ☐ Health reminders are created for upcoming scheduled activities.
- ☐ Users have been invited with the correct roles.
- ☐ The team agrees who records production, inventory, sales, payments, and expenses each day.

Getting help

When reporting a problem, include the page name, the farm date, the flock or record name, what you expected, and what you saw. Do not send passwords, invitation tokens, or payment credentials in a support message.
